The valence shell electron-pair repulsion model successfully accounts for geometrical variations in extensive classes of compounds. According to its basic . Can we prove this with a model—one that will pass the test of properly predicting the shapes of molecules with which. VSEPR models determine the shape of a molecule on the basis of the number of electron groups about the central atom. The text still contains unprecedented macroscopic-to-microscopic molecular illustrations, consistent step-by-step worked exercises in every chapter, and an extensive range of end-of-chapter problems, which provide engaging applications. The VSEPR predicted shapes of molecules can be found in a systematic way by. To predict the shape of the molecules, first draw out the Lewis structure of the.
